

Reflective Statement: Completing my first website

Even though I've been in computer science for many years, I've only written single pages and never completed a complete website. I am very happy to complete this assignment. It's great to be able to successfully complete my first complete front-end website. This project was an enriching learning experience that allowed me to apply my knowledge of HTML, CSS, and JavaScript to create a fully functional and visually appealing online website.

'The Design Document' that I completed earlier gave me a lot of help and allowed me to no longer be blind when making a website. I write html and css based on the layout content of the design. CSS allows me to enhance the visual appeal of my website, ensuring a seamless and engaging user experience. I encountered a little trouble when using Flex and Grid layout here, and the layout result is not very satisfactory to me. But thanks to the almighty Internet, I found a solution in time.

When making 'picture click to enlarge', 'Slide Image' and 'countdown', I inquired about the usage of some JavaScript.

Throughout the production of the website, I encountered various challenges, some due to my limited knowledge, and some due to unexpected problems encountered during the development process. However, each challenge provided me with the opportunity to learn, grow, and refine my skills. I look to the internet for guidance and solutions.

The completion of my first website marked an important milestone in my web creation journey. It gave me a deeper appreciation for the power of code and its potential to create meaningful online experiences. I am eager to continue learning and expanding my skills and believe the foundation laid by this project will serve me well in future endeavors.
